Measuring accuracy

Reference conditions according to IEC 60770

- Ambient temperature TU = constant in the range 18 to 30 °C (64 to 86 °F)
- Relative humidity = constant in the range 30 to 80 %
- Ambient pressure PU = constant in the range 950 to 1060 mbar.
- Measuring span based on zero position
- Transmitter with ceramic or Hastelloy separation diaphragm
- Filling fluid: Silicone oil
- Supply voltage: 24 V DC
- Load with HART: 250 Ω
- Transmitter not grounded
- Characteristic setting: linear, 4 to 20 mA.

Unless otherwise stated, errors are specified as a % of the measuring span value.
The accuracy of the measurement in relation to the upper range limit (URL) is affected by the turndown (TD); i.e., the ratio of the upper range limit (URL) to the set span (URL/span).

FOR OPTIMUM MEASURING ACCURACY, IT IS RECOMMENDED THAT YOU SELECT THE SENSOR CODE WHICH WILL PROVIDE THE LOWEST TD VALUE.

Dynamic response (according to IEC 61298-1)

Reaction time	100 ms
Time constant (63.2 % of total step response)	150 ms

Measuring error for setting cut-off point

Turndown	Measuring error
1:1 to 10:1	± 0.1 %
>10:1	± (0.1 + 0.005 x TD - 0.05) %

Ambient temperature

Thermal change in ambient temperature as regards the zero signal and span (turndown up to 6:1), in relation to the set span

Temperature range	Maximum effect on zero signal and span
-10 to 60 °C (14 to 140 °F)	All measuring ranges ± (0.2 % x TD + 0.2 %)
-40 to -10 °C (-40 to 14 °F)	All measuring ranges ±((0.1 % / 10 K) x TD + (0.1 / 10K))
60 to 85 °C (140 to 185 °F)	

Temperature coefficient (Tk)

Effect of the ambient temperature per 10 K (but limited to the maximum effect of the temperature change, see previous information). The information refers to the set measuring span.

Temperature range	Effect on zero signal and span
-10 to 60 °C (14 to 140 °F)	Sensor code C, F: ± (0.15 % x TD + 0.15 %)
	Sensor code L, D, U, R, V: ± (0.05 % x TD + 0.05 %)

Power supply

Within the specified limits for the voltage / load, the total influence is less than 0.001 % of the upper measuring range limit per volt.

Load

Within the specified load / voltage limits, the total influence is negligible.

Electromagnetic fields

Total influence is less than 0.3 % of measuring span from 80 to 1000 MHz and for field strengths up to 10 V/m when tested with unshielded conduit, with or without meter.

Mounting position

Nominal position: vertical; process connection at bottom. Mounting position deviant from the standard position influence the output due to the filling liquid. With a deviation of 90° from standard position the effect is 1.12 mbar + 0.01 mbar/10K.
This effect can be compensated by carrying out zero signal adjustment and configuring the mounting angle with the LCD indicator or DTM.

Long-term stability

±(0.10 x TD) % / year

Vibration effect

±(0.10 x TD) % acc. to IEC 61298-3

Total performance

Similar to DIN 16086
In the range -10 to 60 °C (14 to 140 °F):
0.42% of the set span (TD 1:1)
The total performance accuracy includes the measuring error (non-linearity including hysteresis and non-reproducibility), as well as the thermal change in the ambient temperature as regards the zero signal and span.

$$E_{perf} = \sqrt{(E_{\Delta TS1} + E_{\Delta TS2})^2 + E_{lin}^2}$$

E_{perf} = Base accuracy
$E_{\Delta TS1}$ = Effect of the ambient temperature on the URL
$E_{\Delta TS2}$ = Effect of the ambient temperature on the measuring span
E_{lin} = Measuring error (for setting cut-off point)
